

## *Investigator is an intelligence-led case management and investigations solution*

It is a repository for all the information and associated documentation that becomes part of any form of investigation.

Information can consist of Incident Reports, Actions, Documents, Images or other core elements of information that you might want to retain as part of your investigation material.

Investigator not only stores all this information in a readily accessible form but has the ability to visually illustrate the connectivity between the information stored using the various relationships that can be attached to all pieces of information.

It is this visualisation that presents the investigator with a graphic view showing the relationships between all the pieces of information associated with the case being investigated including incident reports, documents, images etc.

Investigator is configurable to meet the needs of the organisation undertaking the investigations, be they Police, Insurance or Financial Services organisations.

Entity types within any configuration for an organisation can be totally flexible and all descriptions and terminology can also be customised to best suit the end user's needs. For example, entity types could include people, locations, transactions, incidents, tasks, events, organisations, documents, vehicles or services as appropriate for your organisation.

In addition all entities can have flexibly applied attributes that can extend the detailed data held within entities.

Security is a major element of Investigator and permissions for Roles and Users are extensive and highly protective of all data as required.

Investigator accommodates multi time zones and multiple languages.
