

investigator

Intelligence-led investigation, incident and case management software

investigator

Law enforcement, security and intelligence agencies face continual challenges in handling large information volumes. Sharing the right data between jurisdictions can be a struggle with differing standards, language and cultural boundaries and the sheer ubiquity of data.

secure

With continuing budgetary pressure, constantly evolving terrorist and criminal threats and an increased level of criminal sophistication, expectations have never been higher for law enforcement to undertake massive workloads in order to solve and close cases. It is vital that investigative teams work together closely and share key information in order to improve their overall effectiveness, efficiency and chances of success. Identifying the right information in a timely manner requires robust tools that can manage a high volume of data.

Investigator is a powerful solution that reduces data silos and opens up a wealth of information to an investigative team. With Investigator, agencies proactively manage leads, incidents and cases; track actions and schedule tasks; and make connections between seemingly unrelated pieces of information. Configuration, training and rollout are quick and easy, so teams find value fast.

Simply put, Investigator makes it easier for investigators to do their job and increases the overall effectiveness of the investigative team. >>

Investigator provides a dynamic and cost effective toolkit to investigators and analysts in reactive and proactive investigations. In a time of reduced resources the reliance on technology to direct those resources is a key issue for senior officers and investigators alike and I am convinced that Investigator meets those needs."

DAVID JOHNSTON QPM previous Head of Homicide, Serious Crime, Scotland Yard

Methodware, with its considerable experience of working with its law enforcement clients in more than 20 countries, has built an investigation management platform that truly enables proactive, intelligence-led policing.

user friendly

BENEFITS

Investigator is an entity-based system, using cases, case notes, incident and information reports, tasks and task results to fully manage all aspects of an investigation. Within Investigator, every entity, data field and relationship has a reference document. Even images and voice recordings are entities, allowing them to be related to other entities and connected to one or more cases.

With an object-oriented data model particularly suited to managing relationships between complex sets of data, Investigator's user interface is designed for ease of use, quick configuration and for multiple user types. Front-line investigators and intelligence analysts can work from the same information and terminology, without impacting support.

Investigator supports interfaces with your internal systems as well as key external databases and policing applications. Fully integrated with a sophisticated visual representation capability, Investigator has been built with a clear focus on the operational needs of investigators and their teams.

Fast, easily managed, self-contained and very secure, Investigator is designed to meet the needs of the 21st century investigator.

USER FRIENDLY. Simple to use and understand, yet far from simplistic in its capabilities. Investigator uses your agency's terminology and processes, making its effective use easy to grasp.

ROBUST. A proven system, used in organisations around the world. Investigator helps clients manage cold cases, major investigations, witness protection, financial crime, internal reviews and covert policing—all off a single platform.

CONFIGURABLE. Usable out of the box, but easily customised to suit the structure and work practices of any agency. Configuration and implementation is quick and straightforward. You're up and running in weeks, not months.

SECURE. With a fine grained security model that manages the access to every individual piece of information, Investigator uses a system of roles and permissions to manage access to functionality and data, even across agencies.

SCALABLE. From a single laptop to thousands of users serviced by a wide area network. Investigator can address a specific policing function, or act as a more comprehensive solution, so there is no need to purchase multiple applications.

NATIONAL INTELLIGENCE MODEL. Supports full research, development and analysis of information to provide senior investigators with intelligence to make tactical resourcing decisions about operational policing as well as manage risk.

OTHER KEY FEATURES

Flexible Date and Time Recording. Record and search for exact or unknown dates/times.

Data Storage. Store structured information about any entity and multiple data types.

Entity Watch. Overt or covert notification of other users' access to information.

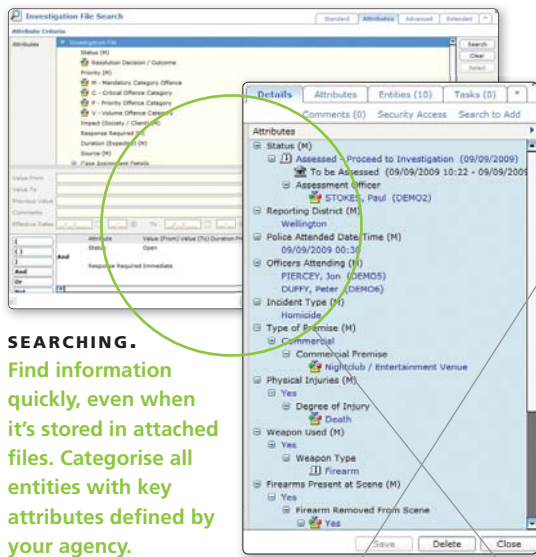

Audit and Evidence. Audit all user actions and prevent users from changing/deleting entries to maintain evidential continuity.

Import and Export. Pass data to models such as the Global Justice XML Data Model and CorDM (Corporate Data Model). Import data from systems such as HOLMES 2.

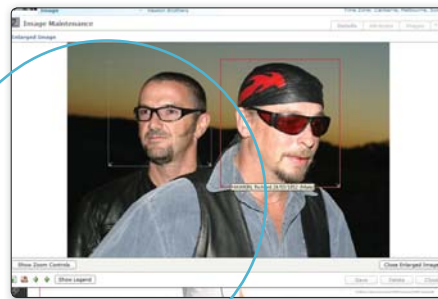

CONNECTING THE DOTS

Display all the elements of an investigation to quickly find what you need.

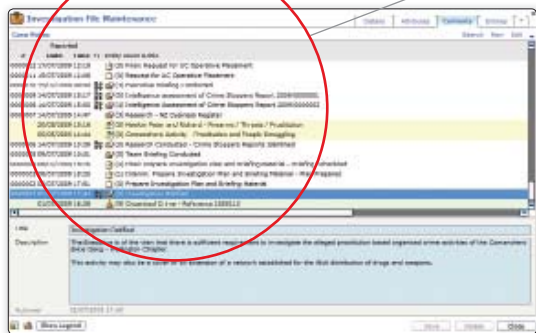

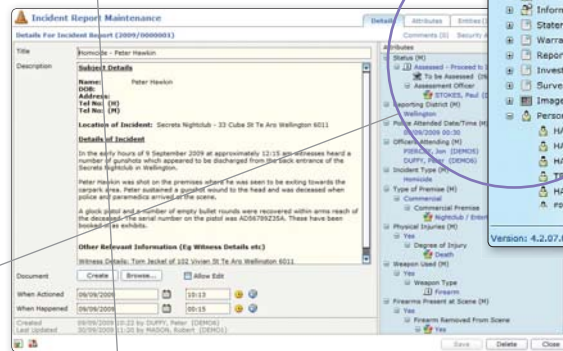

SEARCHING.

Find information quickly, even when it's stored in attached files. Categorise all entities with key attributes defined by your agency.

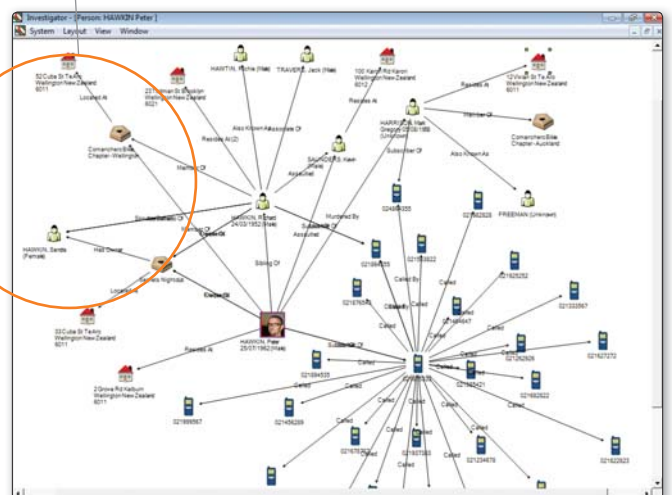

IMAGES. Create hotspots so photos of multiple people can be tagged by individual. Zoom in for a closer look, or drill down for more detail.

TASKING. Keep the investigation running smoothly with tasks, forms and reports. Use the Work Pad as a shortcut for all the key items you need for each case.

CASE LOG. Track what's been done and when. View the log as a list or diagram to determine next steps, identify missing information and go down new paths.

DIAGRAMMING. Explore the relationships between entities using the sophisticated visual representation capability embedded in Investigator.

scalable

methodwareTM

Methodware is a world-leading developer of investigation, risk, compliance and audit software with over 1,800 clients in 80 countries. Our proven solutions are used every day by police forces investigating organised crime, governments fighting corruption, banks to protect against fraud, utilities managing delivery risks and insurance companies safeguarding investments.

investigator

Investigator, our award-winning case management and intelligence-led investigation system, allows us to deliver bespoke industry-specific solutions within law enforcement (cold cases, witness protection, internal investigations, financial crime, CHIS), government agencies and financial services, with clients using it for fraud, corruption, border protection, sports doping and homeland security investigations. With its advanced analytical searching and diagramming tools, Investigator intelligently sifts through mountains of data to find information you can use, whilst efficiently managing workflow to enable your team to quickly advance the investigation without getting distracted with paperwork. Extremely secure, fast to configure and easy to deploy, Investigator lets your team focus on connecting the dots.

The real power of Investigator lies in its ability to manage case activities and visually identify connections between seemingly unrelated information, including all the data captured during past and current investigations. We suddenly gain a 360° view of a piece of information, confident that we can quickly assess its relevance and importance to the investigation."

NICK ANTICICH former Director of Operations,
Corruption & Crime Commission of Western Australia
